

ABSTRACT

A felt pad made for application under the leg of a piece of furniture. This floor protector (20) is used to protect the floor from scratches caused by the furniture displacement. The superior face (26) is infused by an adhesive, instead of the two-sided adhesive tapes (60) which are known. The way the adhesive is infused renders the complete surface of the superior face adherent, which improves the felt pad resistance to shear efforts. It is also much more resistant to water. This innovative felt pad is replaceable when the adhesive is injected unto the upper face (38) of a mushroom-shaped Velcro surface, instead of directly to the superior face of a felt pad. Henceforth, a felt pad may be removeably fixed to the Velcro surface and replaced after wear. In this way, one may change only the felt pad, without having to remove the persisting adhesive below the leg. The felt pad used is in three stages : the top (42) and bottom (46) surfaces being made of felt, while the center stage (48) is reinforced.
